

# Combating Healthcare-associated Infections (HAI)

Healthcare-associated infections are often linked to environmental reservoirs like colonized sink traps. Hospital sink traps can harbour potentially dangerous bacteria and bacterial biofilm. Water flowing into the sink produces droplets and aerosols which can contaminate the surrounding clinical area and come in contact with staff and patients.

## The Problem:

Contaminated Droplets and Aerosols

## The Solution

**MOVEO** Siphon ST24

### THERMAL DISINFECTION

Kills germs in the seal water

### ELECTROMECHANICAL CLEANING

Prevents biofilm development

### SUCCESSFUL DECONTAMINATION

Reduction of bacteria in the seal water by 99.99999%

### MICROBIAL BARRIER

Between waste water system and clean area

### PROVEN TECHNOLOGY

Effectiveness proven in several clinical trials

### GREEN SOLUTION

Continuous disinfection without using chemicals
